

Group Exams with Oral Adjustment

The assignment is to be addressed in groups of 3-5 persons. The purpose of the exams is to test the learning outcomes of the course.

Module leader(s) and e-mail:

Kjeld Hansen – kjeld.hansen@kristiania.no (lecturer & course responsible)

Exam: Bachelor's Project in Groups of 3-5 persons

Students will complete their bachelor's project whilst gaining work experience by completing an IT project in a company for a client. In their work, students will demonstrate broad knowledge of key topics and theories, as well as demonstrate skills in method, use of tools and technologies within the subject area. Students can with advantage draw on previous related knowledge, such as knowledge of development methods, risk management, project work and project management. In addition to this, students must also expect to become acquainted with new knowledge related to the project they are to carry out.

In their project, students must seek to address a problem or a challenge, which is relevant for the company. The solution to be developed is defined in consultation with the company, and must include a significant IT component. It may for example be related to the use of programming languages, tools, methods or software.

The project is carried out in groups and the result of the work is documented in a project report. The deliveries of the project is the solution or product that addresses the project statement, which was agreed with the company, as well as the communication of the process, solution/product and reflections, which is mainly demonstrated in the report, reflection notes and oral adjustment. The students must be able to demonstrate the solution at the oral adjustment.

A Bachelor's project report might include the following elements:

- The research topic – the chosen area for the Bachelor's project.
- The research objective – what do you want to do and what is the goal of this Bachelor's project?
- The research question(s) of your Bachelor's project.
- Why/how is this project important to the company/client?
- An outline of the background for the Bachelor's project based on related and prevailing knowledge relevant for your project.
- A description of the research strategy and method(s) used to address your research problem and question.
- A description of the development method(s) used to develop your solution/product.
- A discussion of the proposed plan and risk factors.
- A presentation of the solution/product that you developed to address the research question.
- A discussion of how you analyse and/or evaluate the solution.
- A discussion of the ethical implications of your Bachelor's project.

- A discussion of your expected contributions to practice.

This is not an exhaustive list. You may include other relevant information that you believe is important to explain your Bachelor's project and the process that you went through to develop it.

Main deliveries:

- The solution/product, which is delivered to the company for a client (worth 50% of the exams)
- The communication of the process, product and reflections (combined worth 50% of the exams) incl.:
 - The Bachelor's report, which should not exceed 12.000 words excluding front page and references
 - A video presentation and demonstration of the solution/product, which should not exceed 2 min
 - Individual and collective reflection notes
 - The oral adjustment exams with a 20 min presentation, 10 min demonstration of the solution and approximately 20 min Q&A session

The written home exams should be written at a level that reflects the lectures, reading materials and an expanded literature search.

Formatting:

The exams report should be in accordance with Kristiania University College's policies.

The exams report should include relevant references to literature.

Language:

The exams report may be written in either Norwegian, Swedish, Danish or English.

Word limit:

The Bachelor's report should not exceed 12.000 words (excluding front page and references).

Grading

The Bachelor's report and supporting documents is graded after the oral adjustment exams. The result is worth 100 % of the grade of the course.

Assessment Criteria* Grade	Learning Outcome 1: Knowledge	Learning Outcome 2: Skills	Learning Outcome 3: Competence
A Excellent	Excellent and comprehensive understanding of theory	Demonstrates excellent analytical, technical and writing skills	Outstanding degree of judgment and independent critical thinking
B Very good	Very good understanding of theory	Demonstrates very good analytical, technical and writing skills	Sound degree of judgment and independent critical thinking
C Good	Good understanding of theory in most important areas	Demonstrates good analytical, technical and writing skills	Reasonable degree of judgment and independent critical thinking

D Satisfactory	Satisfactory understanding of theory, but with significant shortcomings	Demonstrates limited analytical, technical and writing skills	Limited degree of judgment and independent critical thinking
E Sufficient	Meets the minimum understanding of theory	Demonstrates sufficient analytical, technical and writing skills	Very limited degree of judgment and independent critical thinking
F Fail	Fail to meet the minimum academic criteria.	No demonstration of analytical, technical and writing skills	Absence of judgment and independent critical thinking

Assessment guidelines:

A good project should be in compliance with the assignment specifications given above.

The [bachelor's project is a 22,5 study point course](#), which equivalates to approximately 600 hours of work for each student. All students are working in groups of 3-5 unless a medical exemption has been given or group members have left the group during the process. Being able and willing to work in a group is a precondition for the work that you are about to assess though it is not a quality we assess in its own right.

Some groups have experienced a very good process, while others have struggled to develop a good work dynamics. It is not necessarily a reflection of the whole group, if some members have contributed less than proportional. In some cases, it will be possible to separate some individuals contributions from the contributions of the group as a whole - and this can lead to a differentiated grade. If so, there has to be a well-documented reasoning behind it, which can be defended in the case of a grade complaint.

Most bachelor's projects are developed in collaboration with an external collaborator, but some groups are working on internal projects at Kristiania. Some groups might work with resourceful and highly organised external collaborators, while others will work with external collaborators, who are in the process of establishing a business. While it is arguably easier to achieve the learning outcomes in collaboration with a highly organised external collaborator, the assessment must also be mindful of the significant efforts that some groups make in order to plan and steer a good project to completion from a weaker starting point. The projects that are being developed as internal projects at Kristiania are proportionally scoped and supported, but they may come without the added challenge (and motivation) of proving usefulness of the project for the collaborator (one of the learning goals of the bachelor's project).

It has been highlighted to the students that their bachelor's reports must reflect transparency and traceability. In the age of AI, LM/LLM and GPTs, it is too easy to generate both text and code, hence, the ability to keep on topic and to explain oneself is of increasing importance. As such, the thesis should first and foremost reflect a high degree of originality and independence, theoretically and practically. To this end all students have submitted two forms, which declare to what extent and purposes AI (etc) has been used, and that the work you are about to assess is in fact the result of the students' own efforts.

Main deliveries:

- The solution/product, which is delivered to the company for a client (worth 50% of the exams)
 - A good project should have a certain size, level of difficulty and complexity
 - A good project should be well planned and steered to completion as defined by the agreement between the group and the external supervisor (or organisation)
 - A good project is implemented as defined by the agreement between the group and the external supervisor (or organisation)
 - A good project is achieved through a well designed and quality assured process in accordance with the project specifications and established standards
- The communication of the process, product and reflections (combined worth 50% of the exams) incl.:
 - The Bachelor's report, which should not exceed 12.000 words excluding front page and references
 - A good project demonstrates broad knowledge of key topics, theories and scientific methods that are relevant for illuminating a self-chosen problem statement
 - A good project obtains necessary information in a structured way
 - A good project applies relevant theories, practice and subject matter in the work with a problem statement
 - A good project can explain how the project benefits the business/company/external supervisor
 - A good project can describe and evaluate experiences in the project, and what has been learned from the process
 - A good project can use sources and references correctly
 - A video presentation and demonstration of the solution/product, which should not exceed 2 min
 - can design and quality assure the solution in accordance with specifications and established standards
 - can communicate the result of the project in a clear and well-structured way, adapted to the target group
 -
 - Individual and collective reflection notes
 - can describe and evaluate experiences in the project, and what has been learned from the process
- The oral adjustment exams with a 20 min presentation, 10 min demonstration of the solution and approximately 20 min Q&A session
 - can design and quality assure the solution in accordance with specifications and established standards
 - can communicate key subject matter, theories and the solution, both in writing and orally
 - can describe and evaluate experiences in the project, and what has been learned from the process
 - can communicate the result of the project in a clear and well-structured way, adapted to the target group
 - can evaluate how the assignment relates to established knowledge/research in the area

Informal assessment form

Learning outcome	High achievement (A-B)	Medium achievement (C-D)	Low/no achievement (E-F)
Problematisation / Research question relevance			
The problematisation and research question(s) are relevant and interesting within the students' field of study and well justified			
Positioning of the work within the field			
The review of literature and "state of the art" represents a solid and a clear understanding of relevant studies, fields of practice - and is applied directly to position the work within the field			
Method and process			
The methodological choices are well made and motivated, and the empirical process is both clear and transparent			
The process and development methodological choices are well made and motivated, and the system development process is both clear and transparent			
Empirical process			
The insights and findings are well processed, solid and provide an excellent empirical foundation to draw out answers, arguments, design and insights to address the research problem and question			
Solution/product/test			
Clear and concrete presentation and overview of the solution/product/test including its most important layered components. The results are of clear practical relevance.			
Discussion/Conclusion/Contributions			
Clear and concrete discussion and/or conclusion supported by the empirical findings, anchored in literature and/or "state of the art" while clearly addressing the research questions.			
Project management throughout the thesis			
The student(s) can demonstrate competent project management skills (e.g., set objectives, plan, and manage workload(s) and deliverables, monitor outcomes, implementation and manage time).			
Presentation and language			
The thesis is balanced, coherent, consistent, well organized and demonstrates a very well written and visually supported presentation of the topic.
